The engine provides additional retarding by running against compression on downhill hauls. During retarding applications the engine ECM does not inject fuel into the cylinders for exceptional fuel economy. BUILT TO BE REBUILT Cat trucks are designed to last over 100,000 hours, and many are going well beyond that.

With the touch of the button, one-touch idle reduces engine speed to help save fuel; touch it again or move the joystick and the machine returns to normal operating level. The optional heavy lift mode increases machine system pressure to improve lift – a nice benefit in certain situations. Heavy lift mode also reduces engine speed and pump flow

Turbocharger lag (turbo lag) is the time required to change power output in response to a throttle change, noticed as a hesitation or slowed throttle response when accelerating as compared to a naturally aspirated engine. This is due to the time needed for the exhaust system and turbocharger to generate the required boost which can also be referred to as spooling.

The NOx conversion efficiency of the NOx adsorber over the engine map is shown in Figure 2 (data from the SwRI engine benchmarking program). The NOx adsorber reached very high conversion efficiency—at some points above 95%—but the high performance was limited to an area at low-to-medium engine speeds and loads where most of the operating points of the FTP75 cycle would occur.
