Concrete cracks when the tensile strain, ϵ^t , exceeds 0.010 to 0.012 percent. This limiting tensile strain is essentially independent of the concrete strength. The 5 percentile of the tensile strength, f_t , should be used in design to locate areas in the structure that are likely to crack by comparing with the expected ...

Prestressed concrete is a form of concrete used in construction. It is substantially "prestressed" during production, in a manner that subjects the concrete to tensile forces which will exist when in service.: 3–5 This compression is produced by the tensioning of high-strength "tendons" located within the concrete and is done to improve the performance of the concrete in service.
