A transistor is a semiconductor device used to amplify or switch electronic signals and electrical power.Transistors are one of the basic building blocks of modern electronics. It is composed of semiconductor material usually with at least three terminals for connection to an external circuit. A voltage or current applied to one pair of the transistor's terminals controls the current through ...

Step by step instructions: Choose a transistor of the same polarity: The first major selection criterion is whether the transistor is PNP or NPN. Select a replacement transistor of the same material: Most transistors are either silicon or germanium. As bias voltages and other features are different it is necessary to select a replacement transistor with the same material.

In addition, the Q1 transistor can get so hot that it creates cold solder joints on other power supply components. Sometimes even the 5 volt transistor Q1 can fail. The original PMD12K40 transistor is hard to find, but a common replacement is the 2N6057 or 2N6059. This is a 60 volt, 8 amp NPN darlington.
