Convective Heat Transfer Coefficient. As can be seen, the constant of proportionality will be crucial in calculations and it known as the convective heat transfer coefficient, h . The convective heat transfer coefficient, h , can be defined as: The rate of heat transfer between a solid surface and a fluid per unit surface area per unit temperature difference.

Consider a parallel-flow heat exchanger, which is used to cool oil from 70°C to 40°C using water available at 30°C . The outlet temperature of the water is 36°C . The rate of flow of oil is 1 kg/s .
