The size of the window is the aperture, expressed in a fraction. $1/1.4$ is a larger fraction than $1/2$ or $1/8$ or $1/32$. Thus, $f/1.4$ is larger than $f/2$ or $f/8$ or $f/32$. Just think of the f stop as a $1/$ and you will get it quick. The bigger the window, the more light that will come in, all other things held the same.

Aperture's role in photography. There are three main settings you can adjust to get the exposure you want when taking pictures: shutter speed, ISO, and aperture. In digital photography, camera technology now features modes that can help adjust those settings for you. One of those modes is aperture priority.

[Understanding aperture priority mode | Adobe](#)

Shutter speed is measured in seconds. There are varieties of shutter speeds available in digital cameras. The most common available shutter speeds are 1/500, 1/250, 1/125, 1/60, 1/30, 1/15, 1/8. The average shutter speed for the best results is 1/60. Below this, it becomes difficult to handle the camera.

For example, the Canon S120 is my secondary/backup camera, and it has an aperture range of f/1.8 to f/5.7. With a camera like this, I suggest experimenting with apertures between f/3.5 and f/4.5. The point is this: aperture of f/3.5 on one camera may not be equivalent to aperture of f/3.5 on another camera.
