Pascal did not publish any philosophical works during his relatively brief lifetime. His status in French literature today is based primarily on the posthumous publication of a notebook in which he drafted or recorded ideas for a planned defence of Christianity, the Pensées de M. Pascal sur la religion et sur quelques autres sujets (1670).). Nonetheless, his philosophical commitments can be ...

It is estimated that Pascal will achieve 100,000 transactions per second as a theoretical limit (assuming a block size of 5.6 GB) with extensive core factoring, optimizations, and hardware configurations. Pascal's total throughput is essentially only limited by Moore's Law, storage space, and a highly decentralized architecture.

Thank you! That was the exact sort of red thread I was looking for to start unraveling what might be going on! The point you mention with level matching is the exact issue I've had when trying to level match between different devices. I've tried both doing it with test tones, or using peak output when playing back an identical track - in either case it doesn't always seem to give a perfect ...

If you have a problem and If you want to use regular expression to solve that, you now have two problems. ;-) – Ashish Gupta Sep 5 '13 at 3:39 @AshishGupta ;-)

you're right , I do make the problem more complicated to use RegEx to solve . – wlz Sep 5 '13 at 4:00

Atmospheres and Pascals are two important units of pressure.This example problem demonstrates how to convert the pressure units atmospheres (atm) to pascals (Pa). Pascal is an SI pressure unit that refers to newtons per square meter. Atmosphere originally was a unit related to the air pressure at sea level.It was later defined as 1.01325×10^5 Pa.

Torricelli's law, also known as Torricelli's theorem, is a theorem in fluid dynamics relating the speed of fluid flowing from an orifice to the height of fluid above the opening. The law states that the speed v of efflux of a fluid through a sharp-edged hole at the bottom of a tank filled to a depth h is the same as the speed that a body (in this case a drop of water) would acquire in falling ...

History. Johann Bernoulli posed the problem of the brachistochrone to the readers of Acta Eruditorum in June, 1696. He said: I, Johann Bernoulli, address the most brilliant mathematicians in the world. Nothing is more attractive to intelligent people than an honest, challenging problem, whose possible solution will bestow fame and remain as a lasting monument.

"If your only tool is a hammer," goes an old adage, "then every problem looks like a nail." The important 2012 reference work "The Dictionary of Modern

Proverbs" from Yale University Press included an entry for this saying that listed the key early citations in the 1960s.

The SI unit of sound pressure is the pascal (Pa). Other common units for measuring the sound pressure are a newton per square meter (N/m^2), a bar, and a dyne per square centimeter (dyn/cm^2). Sound pressure level (SPL) is a logarithmic (decibel) measure of the sound pressure relative to the reference value of 20μ Pa threshold of hearing.

This law came from a manipulation of the Ideal Gas Law. $$ P \propto \dfrac{1}{V} $$ or expressed from two pressure/volume points: $$ P_1V_1 = P_2V_2 $$ This equation would be ideal when working with problem asking for the initial or final value of pressure or volume of a certain gas when one of the two factor is missing.

The problem goes back to a Hungarian Mathematical competition problem of 1928 (see references). On another page we look at the Lucas numbers Lucas(n) = Fib(n-1) + Fib(n+1) and find that Lucas(i) is Round(Phi i) so the initial-digits-of-powers applies to the Lucas numbers also.
