This result can be understood more simply by considering the torque as arising from a force of constant magnitude F , being applied perpendicularly to a lever arm at a distance r , as shown in the figure. This force will act through the distance along the circular arc $s = r\theta$, so the work done is $W = F s = F r \theta$. Introduce the torque $\tau = F r$, to obtain $W = \tau \theta$, as presented above.

In fluid dynamics, drag (sometimes called air resistance, a type of friction, or fluid resistance, another type of friction or fluid friction) is a force acting opposite to the relative motion of any object moving with respect to a surrounding fluid. This can exist between two fluid layers (or surfaces) or a fluid and a solid surface. Unlike other resistive forces, such as dry friction, which ...

Learn about current. Let's think about current by using an analogy: imagine you pour a bag of corn kernels into a bowl. Each corn kernel is an electron, and the stream of kernels flowing into the bowl is the current. When talking about the flow, you describe it by saying how many kernels are flowing each second.
