Before SQL Server 2017 came along, there wasn't a T-SQL equivalent of the MySQL GROUP\_CONCAT() function. This function allows you to return a result set as a comma-separated list, as opposed to listing each row as a separate row (as with a normal result set). Prior to SQL Server 2017, if you wanted to put your result into a comma separated list, you'd need to find a workaround, perhaps ...

Note that if you use a floating-point value (for example, 2.3) instead of an integer, then PROC SQL ignores the decimal portion. In the ORDER BY clause, you can specify any column of a table or view that is specified in the FROM clause of a query expression, regardless of whether that column has been included in the query's SELECT clause.

[SAS Help Center: Syntax: PROC SQL ORDER BY Clause](#)

Hopefully, it will help developers – both beginner and experienced level – become more proficient in their understanding of the SQL language. Use this as a quick reference during development, a learning aid, or even print it out and bind it if you'd prefer (whatever works!).
