Flow plasticity is a solid mechanics theory that is used to describe the plastic behavior of materials. Flow plasticity theories are characterized by the assumption that a flow rule exists that can be used to determine the amount of plastic deformation in the material.. In flow plasticity theories it is assumed that the total strain in a body can be decomposed additively (or multiplicatively ...

Contact mechanics is the study of the deformation of solids that touch each other at one or more points. A central distinction in contact mechanics is between stresses acting perpendicular to the contacting bodies' surfaces (known as the normal direction) and frictional stresses acting tangentially between the surfaces. This page focuses mainly on the normal direction, i.e. on frictionless ...

The impulse (J_x, J_y) due to the normal force in the x and y directions of a perfectly elastic collision at the moment of contact is: and where m_i and m_j are the masses of particles i and j , and v_i, v_{ix}, v_{iy} and v_j, v_{jx}, v_{jy} are defined as above. Once we know the impulse, we can apply Newton's second law (in momentum form) to compute the velocities ...
